The Laboratory Mouse - Hans Hedrich 2004-08-21

Among animals used in research, teaching and testing, mice are now widely recognized as the most important model for human diseases and disorders. They comprise the majority of all experimental mammals and tend to be the model of choice used for research into many diseases/disorders including cancer, heart disease, asthma, Alzheimer's, Down syndrome, deafness, osteoporosis, obesity, diabetes and even mental health research. Additionally the laboratory mouse continues to play a widely publicized vital role in the human genome project. One of the most time-consuming activities in research laboratories is looking up information specific to the species or strain of animal being used. This book, part of the highly successful Handbook of Experimental Animals series, allows the user quick access to any point of interest on the mouse as an experimental model. * Edited by Hans Hedrich, Hannover Medical School * Comprehensive reference source written by international experts * Well-illustrated with high quality detailed images * Two-color, user-friendly format combined with color plate sections

The Mouse in Biomedical Research, Volume III: Normative Biology, Immunology, and Husbandry focuses on the normative biology, immunology, and husbandry of laboratory mice. Topics covered range from gnotobiotics and gastrointestinal microflora to animal health surveillance and health delivery systems, along with environmental monitoring. The management and design of breeding and research facilities are also discussed. Comprised of 18 chapters, this volume begins with an overview of studies involving gnotobiotic mice, the induction of gnotobiosis, and microbiological testing of gnotobiotic animals. Maintenance of breeding colonies of gnotobiotic animals is also considered, together with the shipment of gnotobiotics and laboratory facilities for using gnotobiotics. The reader is then introduced to management and design of breeding and research facilities for gnotobiotic mice; practical factors associated with providing adequate nutrition for laboratory mice; and environmental and equipment monitoring. Subsequent chapters deal with the basic biology of the mouse, including anatomy, embryology, reproductive physiology, physiology, endocrinology, hematology, clinical biochemistry, and gastrointestinal microflora. The book also examines immunoglobulins and immunoglobulin genes; lymphocyte immunogenetics; immune response disorders; and biotechnology and surgical techniques. This monograph will be useful to biologists, immunologists, researchers, and others those who use mice in the laboratory or are concerned with the production and maintenance of colonies of mice.

Animal Clinical Chemistry - G.O. Evans 2009-04-01
10+ Years of Updates Since First Edition Newcomers to the animal clinical chemistry and toxicology fields quickly find that the same rules of human medicine do not always apply. Following in the footsteps of its standard-setting first edition, *Animal Clinical Chemistry: A Practical Handbook for Toxicologists and Biomedical Researchers*, Second Edition collates information widely dispersed in journals and book chapters, focusing on the most relevant literature to experimental toxicology and its distinction from human medicine. Expands Discussion of Troponins, Lipids, and Electrolytes In addition to tests recommended by regulatory authorities, this globally relevant resource includes information about clinical chemistry tests as well as hepato-, nephro-, cardio-, and endocrine toxicity. It also covers pre-analytical and analytical variables, which play a far more important role with interpreting data from animal studies as compared to human studies when variables can be well controlled with less physiological effect. Furthermore, this edition takes its discussion of biomarkers to the next level, exploring newer and related investigations, such as metabolomics/NMR and multiplex technology. Under the editorial guidance of G.O. Evans, a recognized field authority, the book presents background information on the selection and application of biochemical tests in preclinical safety assessment studies. It also assesses specific organ toxicity, such as in the liver, kidney, and thyroid, along with regulatory requirements and statistical approaches. Careful to avoid delving into overly complex detail, this text is a comprehensive, practical reference ideal for new entrants to the field. However, its broad scope and depth also make it suitable for more seasoned scientists and toxicologists.

The Scid Mouse - Melvin J. Bosma 2013-03-07

During routine genetic screening of several immunoglobulin heavy chain congenic mouse strains in 1980, one of us (MB) was surprised to find that several mice in the C.B-17Icr strain, which was being maintained in a specific-pathogen-free facility of the Fox Chase Cancer Center (Philadelphia, PA), did not express serum immunoglobulin of the

appropriate allotype. Fearing an error in the breeding of these mice, the sera of the suspect mice were screened for other allotypes. When these tests revealed a complete absence of serum immunoglobulin, it became apparent that a mutation had probably occurred in the C.B-17Icr line. Further analysis revealed that a single breeding pair was responsible for all of the immunoglobulin negative mice and that the defect showed recessive inheritance. Thus was the C.B-17/Icr scid or severe combined immune deficient (scid) mouse discovered. Although it has taken most animal facilities several years to breed scid mice of high quality for experimental purpose, it was clear by 1987 that many investigators were beginning to exploit the unique qualities of the scid mouse for studies in several areas.
