The SAGE Handbook of Propaganda - Paul Baines 2019-11-25

The SAGE Handbook of Propaganda tells a radical new story about propaganda, fake news and information warfare and their toxic impact on the communications revolution of the past twenty years. It explains how propaganda invades the human psyche, in what ways it does so, and in what contexts. As a beguiling tool of political persuasion in times of war, peace, and uncertainty, propaganda incites people to take, often violent, action, consciously or unconsciously. This pervasive influence is particularly prevalent in world politics and international relations today. In this interdisciplinary Handbook, the editors have gathered together a group of world-class scholars from Europe, America, Asia, and the Middle East, to discuss leadership propaganda, war propaganda, propaganda for peace marketing, propaganda as a psychological tool, terror-enhanced propaganda, and the contemporary topics of internet-mediated propaganda. This is the first book of its kind, shedding a harsh new light on many current forms and processes ranging from Islamist and Far Right, troll farms and fake news institutes, to the more salient everyday manipulative practices of corporations and brands as well as political parties. In its four parts, the Handbook offers researchers and academics of propaganda studies, peace and conflict studies, media and communication studies, political science and governance marketing, as well as intelligence and law enforcement communities, a comprehensive overview of the tools and context of the development and evolution of propaganda from the twentieth century to the present: Part One: Concepts, Precepts and Techniques in Propaganda Research Part Two: Methodological Approaches in Propaganda Research Part Three: Tools and Techniques in Counter-Propaganda Research Part Four: Propaganda in Context

The Polygraph Test - Anthony Gale 1988

The polygraph lie detection test is currently at the centre of much controversy in both the UK and the US. The Polygraph Test - published by SAGE Publications in association with The British Psychological Society - is the most comprehensive account of issues surrounding the use of the test in criminal investigations, personal screening and security vetting. The book is organized in four parts to present the reader with the basic facts' of how the polygraph test does - and does not - work as well as the wider psychological and legal implications. Part One describes the test, analyses its accuracy, questions its use in psychometrics and considers its role in vetting, investigation and interrogation. Part Two asks questions absolutely fundamental to psychology: can truth and honesty - indeed, even emotion - be measured? Part Three looks at the polygraph test in practice and Part Four considers legal and civil rights issues with contributions from British and American lawyers and a British trade unionist. The Polygraph Test: Lies, Truth and Science will be essential reading to psychologists and students of psychology.

Heavenly Errors - Neil F. Comins 2001-06-27

One of the great paradoxes of modern times is that the more scientists understand the natural world, the more we discover that our everyday beliefs about it are wrong. Astronomy, in particular, is one of the most misunderstood scientific disciplines. With the participation of thousands of undergraduate students, Neil F. Comins has identified and classified, by origin and topic, over 1,700 commonly held misconceptions. *Heavenly Errors* provides access to all of them and explores many, including: Black holes suck in everything around them. The Sun shines by burning gas. Comets have tails trailing behind them. The Moon alone causes tides. Mercury, the closest planet to the Sun, is the hottest planet. In the course of correcting these errors, he explains that some occur through the prevalence of pseudosciences such as astrology and UFOlogy and some enter the public conscience through the "bad astronomy" of Star Trek, Star Wars, and other science-fiction movies.. Perhaps most important, Professor Comins presents the reader with the methods for identifying and replacing incorrect ideas—tools with which to probe erroneous notions so that we can begin to question for ourselves... and to think more like scientists.

Active Learning in College Science - Joel J. Mintzes 2020-02-23

This book explores evidence-based practice in college science teaching. It is grounded in disciplinary education research by practicing scientists who have chosen to take Wieman's (2014) challenge seriously, and to investigate claims about the efficacy of alternative strategies in college science teaching. In editing this book, we have chosen to showcase outstanding cases of exemplary practice supported by solid evidence, and to include practitioners who offer models of teaching and learning that meet the high standards of the scientific disciplines. Our intention is to let these distinguished scientists speak for themselves and to offer authentic guidance to those who seek models of excellence. Our primary audience consists of the thousands of dedicated faculty and graduate students who teach undergraduate science at community and technical colleges, 4-year liberal arts institutions, comprehensive regional campuses, and flagship research universities. In keeping with Wieman's challenge, our primary focus has been on identifying classroom practices that encourage and support meaningful learning and conceptual understanding in the natural sciences. The content is structured as follows: after an Introduction based on Constructivist Learning Theory (Section I), the practices we explore are Eliciting Ideas and Encouraging Reflection (Section II); Using Clickers to Engage Students (Section III); Supporting Peer Interaction through Small Group Activities (Section IV); Restructuring Curriculum and Instruction (Section V); Rethinking the Physical Environment (Section VI); Enhancing Understanding with Technology (Section VII), and Assessing Understanding (Section VIII). The book's final section (IX) is devoted to Professional Issues facing college and university faculty who choose to adopt active learning in their courses. The common

feature underlying all of the strategies described in this book is their emphasis on actively engaging students who seek to make sense of natural objects and events. Many of the strategies we highlight emerge from a constructivist view of learning that has gained widespread acceptance in recent years. In this view, learners make sense of the world by forging connections between new ideas and those that are part of their existing knowledge base. For most students, that knowledge base is riddled with a host of naïve notions, misconceptions and alternative conceptions they have acquired throughout their lives. To a considerable extent, the job of the teacher is to coax out these ideas; to help students understand how their ideas differ from the scientifically accepted view; to assist as students restructure and reconcile their newly acquired knowledge; and to provide opportunities for students to evaluate what they have learned and apply it in novel circumstances. Clearly, this prescription demands far more than most college and university scientists have been prepared for.
