**Topological Geometroynamics** - Matti Pitkanen 2016-03-03

Topological geometrodynamics (TGD) is a modification of the theory of general relativity inspired by the problems related to the definition of inertial and gravitational energies in the earlier hypotheses. TGD is also a generalization of super string models. TGD brings forth an elegant theoretical projection of reality and builds upon the work by renowned scientists (Wheeler, Feynman, Penrose, Einstein, Josephson to name a few). In TGD, Physical space-time planes are visualized as four-dimensional surfaces in a certain 8-dimensional space (H). The choice of H is fixed by symmetries of standard model and leads to a geometric mapping of known classical fields and elementary particle numbers. TGD differs from Einstein's geometrodynamics in the way space-time planes or 'sheets' are lumped together. Extending the theory based on fusing number concepts implies a further generalisation of the space-time concept allowing the identification of space-time correlates of cognition and intentionality. Additionally, zero energy ontology forces an extension of quantum measurement theory to a theory of consciousness and a hierarchy of phases is identified. Dark matter is thus predicted with far reaching implications for the understanding of consciousness and living systems. Therefore, it sets a solid foundation for modeling our universe in geometric terms. Topological Geometroynamics: An Overview explains basic and advanced concepts about TGD. The book covers introductory information and classical TGD concepts before delving into twistor-space theory, particle physics, infinite-dimensional spinor geometry, generalized number theory, Planck constants, and the applications of TGD theory in research. The book is a valuable guide to TDG theory for researchers and advanced graduates in theoretical physics and cosmology.

Horst - Martin Barnes 2014-09-30

Horst P. Horst (1906-1999) was one of the twentieth century's master photographers. A revered figure in the world of fashion image making, he charted sixty years of style for Vogue and House and Garden, from the fashions and celebrities of the 1930s to the interiors of the 1980s. However, little-known within his body of work - and contrasting intriguingly with his career in fashion - is a set of prints and a book, Patterns from Nature (1946). Working with a Rolleiflex and Graphic View Camera in New York, Monterey and Mexico, Horst photographed the detailed textures and forms of natural objects, including plants, rocks, shells and butterfly wings. His close scrutiny of these forms makes them unfamiliar and revelatory. These images were gathered into Patterns from Nature, which also featured 9 kaleidoscopic images made by arranging the photographs in simple repeat. Horst believed that these dynamic patterns would be 'immediately applicable to industrial fields such as textiles, wallpaper, carpets, plastics and glass'.

Published to coincide with a major retrospective on Horst's work at the Victoria and Albert Museum, Martin Barnes re-examines these images in, Horst: Patterns from Nature. This new edition will make the 9 original collaged images available for the first time in nearly 70 years and will also include a further 28 photo-collages that have only recently been rediscovered and have never before been seen or published.
