Behavioral Finance: The Second Generation - Meir Statman 2019-12-02

Behavioral finance presented in this book is the second-generation of behavioral finance. The first generation, starting in the early 1980s, largely accepted standard finance's notion of people's wants as "rational" wants—restricted to the utilitarian benefits of high returns and low risk. That first generation commonly described people as "irrational"—succumbing to cognitive and emotional errors and misled on their way to their rational wants. The second generation describes people as normal. It begins by acknowledging the full range of people's normal wants and their benefits—utilitarian, expressive, and emotional—distinguishes normal wants from errors, and offers guidance on using shortcuts and avoiding errors on the way to satisfying normal wants. People's normal wants include financial security, nurturing children and families, gaining high social status, and staying true to values. People's normal wants, even more than their cognitive and emotional shortcuts and errors, underlie answers to important questions of finance, including saving and spending, portfolio construction, asset pricing, and market efficiency.

STRATEGIC BUSINESS REPORTING - STUDY TEXT. - KAPLAN. 2021

Equity Valuation: Science, Art, or Craft? - Frank J. Fabozzi 2017-12-27

The price at which a stock is traded in the market reflects the ability of the firm to generate cash flow and the risks associated with generating the expected future cash flows. The authors point to the limits of widely used valuation techniques. The most important of these limits is the inability to forecast cash flows and to determine the appropriate discount rate. Another important limit is the inability to determine absolute value. Widely used valuation techniques such as market multiples - the price-to-earnings ratio, firm value multiples or a use of multiple ratios, for example - capture only relative value, that is, the value of a firm's stocks related to the value of comparable firms (assuming that comparable firms can be identified). The study underlines additional problems when it comes to valuing IPOs and private equity: Both are sensitive to the timing of the offer, suffer from information asymmetry, and are more subject to behavioral elements than is the case for shares of listed firms. In the case of IPOs in particular, the authors discuss how communication strategies and media hype play an important role in the IPO valuation/pricing process.

Puzzles of Inflation, Money, and Debt: Applying the Fiscal Theory of the Price Level - Thomas S. Coleman 2021-11-29

The fiscal theory of the price level (FTPL) provides an update and revision of monetary theory to address puzzles raised by the failure of both the new Keynesian theory (commonly used by central bankers) and neoclassical monetarism (in particular, the quantity theory of money as interpreted by Milton Friedman and Anna Schwartz)—puzzles such as the low inflation that followed the sustained expansionary monetary policies post-2008. We aim to summarize and explain the FTPL as developed by Eric Leeper, John

Cochrane, and others. The FTPL builds on neoclassical monetarism by observing that government liabilities—bonds, notes, bills, and currency—derive their value from the assets that back these liabilities. These assets are chiefly the present value of future tax revenues, minus government spending other than that part of spending used to service the liabilities themselves. This net “profit” of the government is called the primary surplus. This primary surplus can be expressed in real terms (a quantity of goods and services, rather than a money amount). The total real value of the bonds is thus the total real value of the assets backing the bonds: the present value of all future real primary surpluses (which we shorten to PVFS, present value of future surpluses). In a very important sense, the FTPL harkens back to commodity-based theories of money, except now the “commodity” is the real value of future surpluses earned by the government. We can then solve for the price level. It is simply the nominal value of the bonds (the face value or number of bonds issued) divided by the real value of the bonds (the PVFS). If the nominal value of the bonds is held constant and the underlying asset (PVFS) becomes less valuable, prices go up. If the PVFS becomes more valuable, prices go down. We thus calculate the value of “money” (including government liabilities of all maturities) the way one would calculate the value of any security: through discounted cash flow analysis. Note that this approach is consistent with the QTM because, if money is defined in the traditional way as currency and demand deposits and we now hold the PVFS (the backing of the money) constant, then the price level is proportional to the amount of money in circulation. The FTPL is a more complete theory, however, because (1) it incorporates all government liabilities, not traditional money alone, and (2) because it is forward-looking and dynamic rather than considering only conditions in the present.
