*Scanning Force Microscopy of Polymers* - G. Julius Vancso 2010-08-02  
Scope of the Book Synthetic and natural polymers exhibit a complex structural and morphological hierarchy on multiple length scales [1], which determines their performance. Thus, research aiming at visualizing structure and morphology using a multitude of microscopy techniques has received considerable attention since the early days of polymer science and technology. Various well-developed techniques such as optical microscopy and different forms of electron microscopy (Scanning Electron Microscopy, SEM; Transmission Electron Microscopy, TEM; Environmental Scanning Electron Microscopy, ESEM) allow one to view polymeric structure at different levels of magnification. These classical techniques, and their applications to polymers, are well documented in the literature [2, 3]. The invention of Scanning Tunneling Microscopy (STM) inspired the development of Atomic Force Microscopy (AFM) and other forms of scanning proximity microscopes in the late 1980s [4, 5]. AFM, unlike STM, can be used to image non-conducting specimens such as polymers. In addition, AFM imaging is feasible in liquids, which has several advantages. Using liquid imaging cells the forces between specimen and AFM probe are drastically reduced, thus sample damage is prevented. In addition, the use of water as imaging medium opened up new applications aiming at imaging, characterizing, and analyzing biologically important systems.

**Advances in Design, Modelling, and Applications of Heat Transfer Equipment** - Zdeněk Jegla 2020-09-16

Heat-transfer equipment, typically represented by, for example, heat exchangers, process furnaces, and steam boilers, is among the essential equipment used for production processes in a number of industries (e.g., chemical and petrochemical, food, pharmaceutical, power, aviation and space) as well as for processes and applications in the communal sphere (e.g., waste incineration plants, heating plants, laundries, hospitals, server rooms, agriculture applications). Increasing demands for economical and efficient heat energy management can only be met when not only the layout of the whole system but also the individual heat-transfer equipment and its details are designed according to state-of-the-art knowledge. The purpose of this Special Issue is to present the latest advances in designing, modeling, testing, and operating heat-transfer equipment, including unconventional and innovative designs of heat-transfer equipment and their applications.

The Integrated Nervous System - Walter J. Hendelman 2017-07-12

This innovative textbook is modelled on problem-based learning. It bridges the gap between academic neuroanatomy and clinical neurology and effectively takes the reader from the classroom to the clinic, so that learning can be applied in practice. This second edition has been updated and expanded to include many more clinical cases within both the book and the accompanying Web site. This book and the associated Web site will be of practical value to all the professionals who deal with people who have neurological conditions, as well as being invaluable to medical students and residents. This includes psychiatrists (rehabilitation medicine specialists), physiotherapists, occupational therapists and speech therapists, and nurses who specialize in the care of neurological patients. We think that this text will also be of value for family physicians and specialists in internal medicine and pediatrics, all of whom must differentiate between organic pathology of the nervous system and other conditions.

Gnostic Philosophy - Tobias Churton 2005-01-25

An extensive examination of the history of gnosticism and how its philosophy has influenced the Western esoteric tradition • Explains how the Gnostic understanding of self-realization is embodied in the esoteric traditions of the Rosicrucians and Freemasons • Explores how gnosticism continues to influence contemporary spirituality • Shows gnosticism to be a philosophical key that helps spiritual seekers "remember" their higher selves  
Gnosticism was a contemporary of early Christianity, and its demise can be traced to Christianity's efforts to silence its teachings. The Gnostic message, however, was not destroyed but simply went underground. Starting with the first emergence of Gnosticism, the author shows how its influence extended from the teachings of neo-Platonists and the magical traditions of the Middle Ages to the beliefs and ideas of the Sufis, Jacob Böhme, Carl Jung, Rudolf Steiner, and the Rosicrucians and Freemasons. In the language of spiritual freemasonry, gnosis is the rejected stone necessary for the

completion of the Temple, a Temple of a new cosmic understanding that today's heirs to Gnosticism continue to strive to create. The Gnostics believed that the universe embodies a ceaseless contest between opposing principles. Terrestrial life exhibits the struggle between good and evil, life and death, beauty and ugliness, and enlightenment and ignorance: gnosis and agnosis. The very nature of physical space and time are obstacles to humanity's ability to remember its divine origins and recover its original unity with God. Thus the preeminent gnostic secret is that we are God in potential and the purpose of bona fide gnostic teaching is to return us to our godlike nature. Tobias Churton is a filmmaker and the founding editor of the magazine *Freemasonry Today*. He studied theology at Oxford University and created the award-winning documentary series and accompanying book *The Gnostics*, as well as several other films on Christian doctrine, mysticism, and magical folklore. He lives in England.

Behold a Pale Horse - William Cooper 2012-04-11

Bill Cooper, former United States Naval Intelligence Briefing Team member, reveals information that remains hidden from the public eye. This information has been kept in Top Secret government files since the 1940s. His audiences hear the truth unfold as he writes about the assassination of John F. Kennedy, the war on drugs, the Secret Government and UFOs. Bill is a lucid, rational and powerful speaker who intent is to inform and to empower his audience. Standing room only is normal. His presentation and information transcend partisan affiliations as he clearly addresses issues in a way that has a striking impact on listeners of all backgrounds and interests. He has spoken to many groups throughout the United States and has appeared regularly on many radio talk shows and on television. In 1988 Bill decided to "talk" due to events then taking place worldwide, events which he had seen plans for back in the early '70s. Since Bill has been "talking," he has correctly predicted the lowering of the Iron Curtain, the fall of the Berlin Wall and the invasion of Panama. All Bill's predictions were on record well before the events occurred. Bill is not a psychic. His information comes from Top Secret documents that he read while with the Intelligence Briefing Team and from over 17 years of thorough research. "Bill Cooper is the world's leading expert on UFOs." -- Billy Goodman, KVEG, Las Vegas. "The only man in America who has all the pieces to the puzzle that has troubled so many for so long." -- Anthony Hilder, Radio Free America "William Cooper may be one of America's greatest heroes, and this story may be the biggest story in the history of the world." -- Mills Crenshaw, KTALK, Salt Lake City. "Like it or not, everything is changing. The result will be the most wonderful experience in the history of man or the most horrible enslavement that you can imagine. *Calculations in Furnace Technology* - Clive Davies 2016-05-13

*Calculations in Furnace Technology* presents the theoretical and practical aspects of furnace technology. This book provides information pertinent to the development, application, and efficiency of furnace technology. Organized into eight chapters, this book begins with an overview of the exothermic reactions that occur when carbon, hydrogen, and sulfur are burned to release the energy available in the fuel. This text then evaluates the efficiencies to measure the quantity of fuel used, of flue gases leaving the plant, of air entering, and the heat lost to the surroundings. Other chapters consider that it is important to determine the amount of carbon discharged with the ashes, the quantity and composition of any tar produced, so that a carbon balance can be applied. The final chapter describes the various reactions within the furnace atmosphere and between charges and atmosphere. This book is a valuable resource for fuel technologists, heating and ventilating engineers, and plant operators.

history of technology in industry.

Laser Science and Technology - A.N. Chester 2012-12-06

The conference "Laser Science and Technology" was held May 11-19, 1987 in Erice, Sicily. This was the 12th conference organized by the International School of Quantum Electronics, under the auspices of the "Ettore Majorana" Center for Scientific Culture. This volume contains both the invited and contributed papers presented at the conference, covering current research work in two areas: new laser sources, and laser applications. The operation of the first laser by Dr. Theodore Maiman in 1960 initiated a decade of scientific exploration of new laser sources. This was followed by the decade of the 1970s, which was characterized by "technology push" in which the discoveries of the 1960s were seeking practical application. In the 1980s we are instead seeking "applications pull," in which the success and rapid maturing of laser applications provides both inspiration and financial resources to stimulate additional work both on laser sources and applications. The papers presented in these Proceedings attest to the great vitality of research in both these areas: New Laser Sources. The papers describe current developments in ultra violet excimer lasers, X-ray lasers, and free electron lasers. These new lasers share several characteristics: each is a potentially important coherent source; each is at a relatively short wavelength (below 1 micrometer); and each is receiving significant development attention today.

Combustion Noise - Anna Schwarz 2009-06-17

November, 2008 Anna Schwarz, Johannes Janicka In the last thirty years noise emission has developed into a topic of increasing importance to society and economy. In fields such as air, road and rail traffic, the control of noise emissions and development of associated noise-reduction technologies is a central requirement for social acceptance and economical competitiveness. The noise emission of combustion systems is a major part of the task of noise reduction. The following aspects motivate research: • Modern combustion chambers in technical combustion systems with low pollution exhausts are 5 - 8 dB louder compared to their predecessors. In the operational state the noise pressure levels achieved can even be 10-15 dB louder. • High capacity turbines in the chemical industry are usually placed at ground level because of the reasons of noise emissions instead of being placed at a height suitable for safety and security. • For airplanes the combustion emissions become a more and more important topic. The combustion instability and noise issues are one major obstacle for the introduction of green technologies as lean fuel combustion and premixed burners in aero-engines. The direct and indirect contribution of combustion noise to the overall core noise is still under discussion. However, it is clear that the core noise besides the fan tone will become an important noise source in future aero-engine designs. To further reduce the jet noise, geared ultra high bypass ratio fans are driven by only a few highly loaded turbine stages.

**Transnational Religious Spaces** - Philip Clart 2020-07-06

This volume, bringing together work by scholars from Europe, East Asia, North America, and West Africa, investigates transnational religious spaces in a comparative manner by juxtaposing East Asian and African examples. It highlights flows of ideas, actors, and organizations out of, into, or within a given continental space. These flows are patterned mainly by colonialism or migration. The book also examines cases where the transnational space in question encompasses both East Asia and Africa, notably in the development of Japanese new religions in Africa. Most of the studies are located in the present; a few go back to the late nineteenth century. The volume is rounded off by Thomas Tweed's systematic reflections on categories for the study of transnationalism; his chapter "Flows and Dams" critically weighs the metaphorical language

we use to think, speak, and write about transnational religious spaces.

**Natural Products and Their Active Compounds on Disease Prevention** - M. Mohamed Essa 2012

It is well documented that most natural products are enriched with bioactive components that have protective action. There is currently a growing body of evidence that supplementing the human diet with natural products is of major benefit for human health and well-being. Nowadays, the use of complementary/alternative medicine, functional food and especially the consumption of natural products have been increasing rapidly world-wide, mostly because of the supposedly less frequent side effects. Both in conventional and traditional medicines, natural products continue to provide valuable therapeutic agents. The issues regarding the efficacy and safety of currently available modern medicine agents have prompted the search for safer and more effective alternatives. This book focuses on implications of traditional and processed foods for health and disease prevention.

**Fire in the Minds of Men** - James H. Billington 1999

This book traces the origins of a faith--perhaps the faith of the century. Modern revolutionaries are believers, no less committed and intense than were Christians or Muslims of an earlier era. What is new is the belief that a perfect secular order will emerge from forcible overthrow of traditional authority. This inherently implausible idea energized Europe in the nineteenth century, and became the most pronounced ideological export of the West to the rest of the world in the twentieth century. Billington is interested in revolutionaries--the innovative creators of a new tradition. His historical frame extends from the waning of the French Revolution in the late eighteenth century to the beginnings of the Russian Revolution in the early twentieth century. The theater was Europe of the industrial era; the main stage was the journalistic offices within great cities such as Paris, Berlin, London, and St. Petersburg. Billington claims with considerable evidence that revolutionary

ideologies were shaped as much by the occultism and proto-romanticism of Germany as the critical rationalism of the French Enlightenment. The conversion of social theory to political practice was essentially the work of three Russian revolutions: in 1905, March 1917, and November 1917. Events in the outer rim of the European world brought discussions about revolution out of the school rooms and press rooms of Paris and Berlin into the halls of power. Despite his hard realism about the adverse practical consequences of revolutionary dogma, Billington appreciates the identity of its best sponsors, people who preached social justice transcending traditional national, ethnic, and gender boundaries. When this book originally appeared *The New Republic* hailed it as "remarkable, learned and lively," while *The New Yorker* noted that Billington "pays great attention to the lives and emotions of individuals and this makes his book absorbing." It is an invaluable work of history and contribution to our understanding of political life.
